

Efficient theft/loss protection

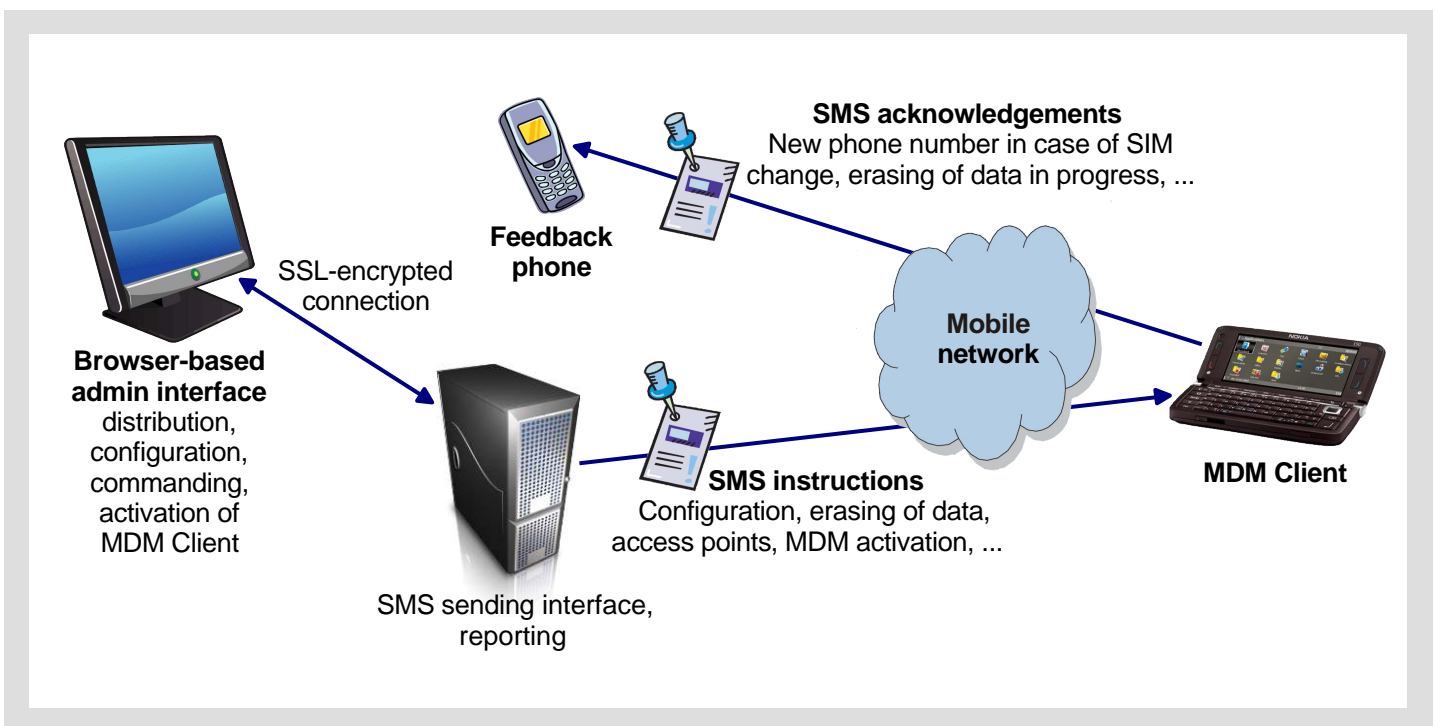

Starting from version 1.72, MDM Client can be installed in Express mode. In Express mode, MDM Client does not require data connections to MDM Server; instead, MDM Client is configured and instructed with SMS messages.

The MDM Client Express mode features are:

- Erasing of data on device and memory card if SIM card is changed
- Sending of SMS message to pre-defined number in case of SIM card change
- 100% silent provisioning of access points
- Activation of MDM Client to active (normal) mode

All the features are configurable by SMS messages – also erasing of data can be initiated by an SMS message. Each SMS instruction is authenticated on device.

Erasing of data on device and memory card is performed with diligence – data is not only erased but also overwritten. Unlike with built-in “device wipe” and “factory settings” operations, data can’t be restored after being erased.

Fromdistance offers simple, browser-based interface for administering devices equipped with MDM Client. This service comes with everything necessary – including SMS sending interface. Also co-branding is possible.

MDM Client Express mode can be activated 100% silently with an SMS message into full-blown Fromdistance MDM solution, the most comprehensive enterprise device management solution on the market.
