

Fromdistance releases device management for Android

Press release, for release on March 31, 2010

Fromdistance has released device management support for Android devices. The publicly available device management client marks the 6th device platform supported by Fromdistance MDM – the previous ones being Symbian S60, RIM BlackBerry, Windows Mobile, Windows CE and PC Windows (XP, Vista, 7).

By supporting Android as a device platform, Fromdistance makes the Android devices truly enterprise-grade tools. Device management provides remote management of mobile devices and beyond. For companies, a device management system means better control and security as well as increased efficiency.

“The new Android 2 devices will certainly have a significant impact on the enterprise mobility market. Fromdistance is happy to support the Android platform already now when the first devices are being taken into serious use by our customers”, says Jouko Vierumäki, CEO and founder of Fromdistance.

Fromdistance MDM Client for Android supports operating system versions starting from 2.0. The most important Android devices running the old 1.5/1.6 operating system can be updated to new 2.x versions. Fromdistance MDM Client software is available at mdmclient.net.
